Projects

Bankist Website Project

Creating an informative and user friendly website. Using DOM manipulation and events to make the website interactive and convenient for the user. This website contains a slide bar, a sticky navigation and smooth scrolling to make for an enjoyable web view of the user.

Bankist App Project

This is a banking application where the User can login to their account by entering a username and password. Once access has been granted the user has the option to view his balance sheet as well as make a transfer, request a loan or close said account. This application was constructed by using array and array methods.

Mapty App Project

Exercise Map Project. On opening the project the user map gets centered to his location. The user can then click on the map to add a workout. After clicking on the map the user can choose between two exercise types and enter the required data to render it on the map. OOP and Geolocation was used for this project.

Forkify App Project

This project encompass all the segments of finding and altering a recipe. The website allows the user to search for a desired recipe and thereafter alter the serving size to determine the quantity of ingredients needed. API's were used to obtain the information and render it to the website.
